## IJCNN 2023: Celebrating 80 Years of Neural Networks

Neural Networks (NN) have been major techniques for the development of Computational Intelligence (CI) for more than 80 years now, since the conception of the Perceptron in 1943 by Warren McCulloch and Walter Pitts, with the first implementation as a machine built in 1958 by F. Rosenblatt. Now NN have become *the dominant* techniques for CI. The new developments in NN are based on all previous studies and are ubiquitous across all areas of science, technologies and societies. We are seeing new developments of deep neural networks, long short-term memory networks, transformers, neuro-fuzzy systems, neuroevolutionary systems, brain-inspired spiking neural networks, neuromorphic chips, NN based supercomputers and many more.

All the current advancements in the current NN research and technologies are based on the work of pioneers and leaders in this area, such as: F. Rosenblatt, S. Amari, M. Minsky, D. Rumelhart, P. Werbos, B. Widrow, K. Fukushima, T. Kohonen, J. Taylor, S. Grossberg, G. Carpenter, J. Hinton, and many more.

NN research is much inspired by the human brain and the advancements in *neuroinformatics*. And the most prominent NN models have been used back to understand, to cure and to protect the human nervous system. There is a long list of pioneers in neuroinformatics, such as: Hodgkin and Huxley, W. Freeman, M. Arbib, S. Grossberg, J. Hopfield and many more.

NN research was also developed in the direction of *explainability* and here stands out *fuzzy logic* by L. Zadeh (1956), which contributed significantly to a further development of neuro-fuzzy and evolving systems by pioneers such as T. Yamakawa, K. Hirota, J. Mendel, L. Koszy, I. Rudash, B. Kosko, and many more.

We are seeing a fast development of neuromorphic systems and NN-based supercomputers by the leading computer companies, such as IBM, Intel and Microsoft, along with the pioneering work of many scientists and engineers, such as C. Mead, S. Furber, G. Indiveri, and T. Delbruck.

The International Joint Conferences on Neural Networks (IJCNN) annual conference series is by far the biggest and the most prestigious forum to report on the new developments in neural networks, neuroinformatics and neuro-technologies. It is co-organised and co-sponsored by the *International Neural Network Society (INNS)* and the *IEEE Computational Intelligence Society*. It has a long history, with the first conference held in 1987, chaired by S. Grossberg.

The IJCNN 2023, held in the beautiful Gold Coast of Australia is one of the largest forums among all IJCNN conferences, with over 1000 papers presented and published in the IEEE IJCNN Proceedings. We would like to congratulate the participants with their accepted papers and to acknowledge the hard work of the program and organising committees to make this event happen.

Welcome to IJCNN2023!

Brijesh Verma, General Co-Chair

## Welcome Message from the President of INNS

On behalf of the International Neural Network Society (INNS), it is my utmost pleasure to extend a warm welcome to all of you attending this year's International Joint Conference on Neural Networks (IJCNN) in Gold Coast, Australia. IJCNN 2023 reflects the mission of INNS, a society established in 1987 as the first international, interdisciplinary and inclusive professional organisation focusing on theoretical and computational aspects of brain-inspired learning machines.

This year's IJCNN represents a significant milestone as we are marking the 80th anniversary of the conception of artificial neural networks (McCulloch and Pitts, 1943), a technology which has underpinned and revolutionised numerous fields, from artificial intelligence to healthcare, finance to robotics, through to the ways we communicate and learn, and beyond. Gold Coast, with its vibrant atmosphere and breath-taking natural beauty, provides the perfect backdrop for this extraordinary gathering of neural network researchers and enthusiasts from around the globe.

Throughout the conference, you will have the opportunity to engage with esteemed researchers, industry leaders, and fellow enthusiasts. I encourage you to take full advantage of the diverse range of sessions, workshops, poster presentations, educational and career activities – such as the INNS Town Hall Luncheon or the Explainable AI & Automated Machine Learning (XAI/AML) Section Meeting. I wish for everyone that the conference provides an ideal platform to network, forge collaborations, and form lasting professional relationships that will enrich our academic and professional journey. Please do not forget to enjoy the beautiful Gold Coast, be it in terms of “scientific discourses” with the seagulls (over the rights to fish and chips for dinner) or by absorbing the magic of the sunset at the SkyPoint Observation Desk, ensuring that your time here is as enjoyable as it is intellectually stimulating.

I would like to express my deepest appreciation to the IJCNN 2023 General Chairs (Brijesh Verma and Nikola Kasabov), Program Co-Chairs (Lipo Wang, Teresa Ludermir, and Tom Gedeon), Technical Co-Chairs (Marley Vellasco, Mengjie Zhang, and Chrisina Jayne), our sponsors and team of enthusiastic volunteers, who have dedicated enormous time and effort to make this event possible.

Each year, the International Neural Network Society presents several awards recognizing outstanding contributions in the field of neural networks. I would like to congratulate this year's recipients of the Lifetime Contribution Awards, recognizing:

- Zeng-Guang Hou with the Dennis Gabor Award, for outstanding contributions to engineering applications of neural networks
- Bart Kosko with the Donald O. Hebb Award, for outstanding contributions to research in biological learning
- Daniel Wolpert with the Hermann von Helmholtz Award, for outstanding contributions to research in perception

I wish you all a truly remarkable and memorable experience at the International Joint Conference on Neural Networks in Gold Coast, Australia. Your presence here signifies the dedication and passion for neural networks of all of us, and it is this collective effort and interaction that will shape the future of this field.

“Have a great conference, mate.”

Danilo Mandic  
President of the International Neural Network Society

## Welcome Message from the President of IEEE-CIS

As the President of the IEEE Computational Intelligence Society (CIS), I very pleased to welcome all the delegates to this important event, the 2023 International Joint Conference on Neural Networks (IJCNN), July 18 - 23, 2023, Gold Coast, Queensland, Australia. The IEEE CIS and the International Neural Networks Society (INNS) have been jointly organizing IJCNN for many years. On odd numbered years, like this year, INNS takes the lead in running the conference, while on even numbered years, IJCNN is organized as a part of the IEEE World Congress on Computational Intelligence (WCCI). The 2024 edition of the IJCNN will be held as a part of WCCI 2024, June 30 – July 5, 2024, in Yokohama, Japan (<https://wcci2024.org/>).

No one, these days, can doubt the central role of Neural Networks in the AI explosion. Our two societies (INNS and CIS) have led, and continue to lead, research and development in this crucial component of modern machine learning and AI. We are much stronger together than apart. We even have a tradition that the Presidents of the respective societies exchange a “tie of friendship” at the Awards Banquet during the WCCI congress years. (In 2020, it was a “scarf of friendship” as both Presidents were women.) Those who know me won’t be surprised that the tie I gave to Danilo Mandic last year in Padua, Italy was a Hawaiian shirt print tie. The symbolism is there to underscore our mutual commitment to jointly advance this incredibly important field. The 2023 IJCNN program spans the breadth with significant depth of all aspects of neural networks and machine learning from theory to algorithm development to incredible applications addressing some of the big problems facing our planet. This is being done in a hybrid format to accommodate as many participants as possible as we still recover from the pandemic. There are numerous opportunities offered by a great lineup of tutorials, workshops and plenary addresses by pioneers of this field. Speaking of Pioneers, Donald C Wunsch II, who has been a strong contributor to both societies for many years will be presented the IEEE CIS Neural Network Pioneer Award at IJCNN 2023 “For contributions to unsupervised and reinforcement learning”. The Pioneer Awards (Neural Networks, Fuzzy Systems, Evolutionary Computation) are the highest CIS awards. Congratulations, Don!

Please take as many opportunities as possible to network with each other. That’s the real beauty of conference participation. For those new to the field, I invite you to make IJCNN a regular part of your yearly activities. And please consider becoming more deeply involved in both societies in some volunteer roles. You will get back much more than you give.

The creation and organization of this diverse program takes a lot of work. I extend my sincere thanks to the general chairs, every member of the organizing committee, and the program committee, with a special nod to the program chairs. But such a strong technical program cannot have high quality without diligent article referees. So “hats off” to all of you reviewers for your sincere efforts. Of course, the reviewers wouldn’t have any work

to do without all of the authors who are willing to share their research with the broader community. Thank you for supporting IJCNN. Last, but not least, I sincerely express my gratitude to the volunteers of both CIS and INNS, who have worked synergistically to make this event happen. I wish all of you to have an exciting and meaningful conference. Enjoy and enrich yourself in this beautiful setting. I hope to see you at WCCI 2024 in Yokohama.

Jim Keller  
President  
IEEE Computational Intelligence Society

**“Multi-objective Ensemble Learning and Its Applications”**

*Southern University of Science and Technology*

**Abstract:** Most, if not all, machine learning problems are defined by a single loss function. Yet the vast majority of those loss functions have two or more terms summed together through hyper-parameters. A closer examination of those loss functions reveals that there are in essence two or more conflicting objectives that a loss function tries to minimise, e.g., accuracy and regularisation. This talk formulates machine learning as a multi-objective problem, instead of trying to combine different objectives into a single loss function through a weighted sum. While the weighted sum approach is simpler, it does require additional time and effort to tune hyper-parameters (weights). This talk starts with ensemble learning. Then it describes a simple idea of multi-objective learning and its natural fit to ensembles. Existing multi-objective evolutionary algorithms can be used as multi-objective learning algorithms without requiring the objective functions to be differentiable or even continuous. Selected examples of multi-objective learning in class imbalance learning, software effort estimation and fair machine learning will be presented to illustrate the flexibility and generality of multi-objective learning. It is argued that multi-objective learning can be an effective approach towards achieving different trade-off in various practical learning scenarios.

**“Modelling The Neural Mechanisms of Navigation In Insects”**

*University of Edinburgh*

**Abstract:** Insect navigation has been a focus of behavioural study for many years, and provides a striking example of cognitive complexity in a miniature brain. We have used computational modelling to bridge the gap from behaviour to neural mechanisms by relating the computational requirements of navigational tasks to the type of computation offered by invertebrate brain circuits.

We have shown that visual memory of multiple views could be acquired by associative learning in the mushroom body neuropil, and allow insects to recapitulate long routes. We have also proposed a circuit in the central complex neuropil that integrates sky compass and optic flow information on an outbound path and can thus steer the animal directly home; moreover this circuit can be used for additional vector calculations such as finding novel shortcuts. The models are strongly constrained by neuroanatomy, and are tested in realistic agent and robot simulations.

**“Learning With No Data Collections”**

University of Siena

**Abstract:** By and large, the spectacular results of machine learning rely on the appropriate organization of huge data collections, which has strongly pushed the development of top level solutions by big companies. In this talk we propose an orthogonal research direction where we expect that perceptual cognitive skills (e.g. in language, vision, and control) can emerge simply by of environmental interactions without needing to store and properly organize big data collections. The proposed approach relies on moving the framework of statistical machine learning to that of learning over time by solving optimization problems similar to those that are at the basis of laws in Physics. We show that any classic learning process arises from the forward solution of classic variational problems and provide preliminary experimental evidence of the effectiveness of the theory.

**“Neural Spectrospatial Filter: On Beamforming in the Deep Learning Era”**

Ohio State University

**Abstract:** As the most widely-used spatial filtering approach for multi-channel signal separation, beamforming extracts the target signal arriving from a specific direction. We present an emerging approach based on multi-channel complex spectral mapping, which trains a deep neural network (DNN) to directly estimate the real and imaginary spectrograms of the target signal from those of the multi-channel noisy mixture. In this all-neural approach, the trained DNN itself becomes a nonlinear, time-varying spectrospatial filter. How does this conceptually simple approach perform relative to commonly-used beamforming techniques on different array configurations and in different acoustic environments? We examine this issue systematically on speech dereverberation, speech enhancement, and speaker separation tasks. Comprehensive evaluations show that multi-channel complex spectral mapping achieves speech separation performance comparable to or better than beamforming for different array geometries, and reduces to monaural complex spectral mapping in single-channel conditions, demonstrating the versatility of this new approach for multi-channel and single-channel speech separation. In addition, such an approach is computationally more efficient than popular mask-based beamforming. We conclude that this neural spectrospatial filter is capable of superseding traditional and mask-based beamforming.

**“Bayesian inference, reinforcement learning, and the cortico-basal ganglia circuit”**

Okinawa Institute of Science and Technology

**Abstract:** Bayesian inference is a standard way of handling uncertainties in sensory perception and reinforcement learning is a common way of acting in unknown environments. While they are used in combination for perception and action in uncertain environments, the similarity of their computations has been

formulated as the duality of inference and control, or control as inference. In this talk, I will review these theoretical frameworks and discuss their implications in understanding the common circuit architectures of the sensory and motor cortices, and possible roles of the basal ganglia in motor and sensory processing.

**Nikola K Kasabov**

**“Neuroinformatics, Neural networks and Neurocomputers for Brain-inspired AI: Challenges and Opportunities”**

Auckland University of Technology

**Abstract:** The talk discusses briefly current challenges in AI, including: efficient learning of data (interactive, adaptive, life-long; transfer); interpretability and explainability; personalised predictive modelling and profiling; multiple modality of data (e.g. genetic, clinical, behaviour, cognitive, static, temporal, longitudinal);

computational complexity; energy consumption; human-machine interaction.

Opportunities to address these challenges are presented through advancement in Neuroinformatics, Neural networks and Neurocomputers (the 3N). Neuroinformatics offer a tremendous amount of data and knowledge about how the human brain and the nervous system work. Many brain information processing principles can be now implemented in novel Neural network computational models, such as: sparseness of computation, leading to a much less computational complexity and a significant energy consumption; diversity in the NN architecture in terms of type of neurons and compartmentalisation of computations, which can improve results; cognitive computation, where bottom-up sensory information and top-down prior knowledge are used to speeds-up the learning process; life-long and transfer learning; interactive and reinforcement learning (rather than batch-mode); self-organisation (rather than pre-defined number of layers and neurons); evolving spatio-temporal knowledge and many more. Some of these principles have already been used in neural network models, such as SOM (Kohonen), ART (Grossberg), ECOS ([1,2]), spiking neural networks (SNN) (Maass), [3]. The latter ones have inspired the development of neuromorphic hardware chips and Neurocomputers, characterised by much low power consumption, massive parallelism and fast processing.

## Competition

### Competition on Reproducibility and Loss Landscape Mapping in Feed-forward Neural Networks

**Date:** Tuesday, June 20

**Room:** Arena 1B

**Organizer:** Marcus Gallagher

**Abstract:** Feed-forward neural networks (aka multilayer perceptrons) have been widely applied to supervised learning problems since the mid-1980s. Over this time, thousands of different datasets have been used in thousands of different experimental studies, with results reported in the literature. This research has helped to fuel tremendous progress in the field. However, documented reproduction of published experimental results has never been attempted in many cases. The availability of computational resources, software libraries and datasets creates the opportunity to attempt to reproduce and even expand on experiments that previously took a large amount of time. In addition, it is possible to run experiments not just to try and locate single best minimizer of the training loss function, but to collect and explore numerous convergence points on a loss landscape, to better understand the properties of problem instances (e.g. in relation to multimodal optimization and exploratory-driven techniques such as quality-diversity search).

The goal of this competition is to challenge researchers to: (a) attempt to reproduce an existing experimental study and report on their findings (including successes, failures and lessons learned); and/or (b) carry out an experimental study on the loss landscape of a neural network training problem instance to reveal new insights (including finding multiple high-quality solutions and points of attraction for different training algorithms).

## Workshops

All Workshops will take place on Friday, June 23

**Workshop:** Multimodal Synthetic Data for Deep Neural Networks (MSynD)

**Organizer(s):** Moshir Farazi, Olivier Salvado, Zeeshan Hayder, Mohammad Ali Armin, Xun Li, Ali Cheraghian

**Time:** 8:00 – 12:30

**Room:** Room 1

**Abstract:** The use of synthetic data in training and evaluating deep neural networks has become increasingly popular in recent years, due to its ability to provide large amounts of diverse and customizable data for training and testing. Traditional training data are mostly collected from real world scenarios which make them expensive, time-consuming to acquire, and often require expert knowledge for annotation. Synthetic data on the other hand is artificially generated and has the advantage of being easily controllable and scalable, making it possible to generate large amounts of data for a wide range of tasks, without compromising the privacy of individuals or commercial interests. In addition to this, synthetic data provide a unified labelling framework that can be exploited for multi-task learning. However, many current approaches to synthetic data generation and application focus on single modalities, such as audio, video, text, and sensor data, and do not adequately capture the multimodal nature of many real-world data sets. In this workshop, we propose to explore the challenges and opportunities of using synthetic data in multimodal deep learning applications. We are aiming to bring together researchers and practitioners from a variety of academic and industrial disciplines to discuss the recent advances in multimodal synthetic data generation, and to showcase successful examples of their usage in deep neural network applications. Attendees will have the opportunity to learn about the latest techniques and tools for generating and using synthetic data, and to apply these techniques to their own research problems. This workshop is intended for researchers and practitioners working in the fields of deep learning and artificial intelligence.

**Workshop:** Autonomous Learning in Complex Decision Situations

**Organizer(s):** Luis Martínez, Ivor W Tsang, Jie Lu, Feng Liu, Jun Wang, Xin Yao

**Time:** 8:00 – 12:30

**Room:** Room 3

**Abstract:** The aim of the workshop is to create an integrated and holistic computational foundation for a new research direction – autonomous learning in complex decision situations. We define a decision situation as complex if the data available for use in machine learning efforts is massive and/or uncertain and/or dynamic. Autonomous learning will advance the capability of machines to learn from complex situations and minimise human involvement in the learning process (such as to autonomously determine a threshold, a sample set, a source domain, a concept drift, and a policy). Recently we have seen several new successful developments in the direction, such as massive stream learning algorithms, incremental and online learning for streaming data. These developments have demonstrated how the autonomous learning can be used in some complex decision situations to contribute to the implementation of machine learning capability. We have also witnessed some compelling evidence of successful investigations on the use of the autonomous learning methodology to support real-time prediction and decision making in practice. With these observations, it is instructive, vital, and timely to offer a unified view of the current trends and form a broad forum for the fundamental and applied research as well as the practical development of autonomous learning in complex decision situations for improving machine learning and data-driven decision support systems.

Most, if not all, machine learning problems are defined by a single loss function. Yet the vast majority of those loss functions have two or more terms summed together through hyper-parameters. A closer examination of those loss functions reveals that there are in essence two or more conflicting objectives that a loss function tries to minimise, e.g., accuracy and regularisation. This talk formulates machine learning as a multi-objective problem, instead of trying to combine different objectives into a single loss function through a weighted sum. While the weighted sum approach is simpler, it does require additional time and effort to tune hyper-parameters (weights). This talk starts with ensemble learning. Then it describes a simple idea of multi-objective learning and its natural fit to ensembles. Existing multi-objective evolutionary algorithms can be used as multi-objective learning algorithms without requiring the objective functions to be differentiable or even continuous. Selected examples of multi-objective learning in class imbalance learning, software effort estimation and fair machine learning will be presented to illustrate the flexibility and generality of multi-objective learning. It is argued that multi-objective learning can be an effective approach towards achieving different trade-off in various practical learning scenarios.

**Modelling The Neural Mechanisms of Navigation In Insects**

Barbara Webb

*University of Edinburgh*

Insect navigation has been a focus of behavioural study for many years, and provides a striking example of cognitive complexity in a miniature brain. We have used computational modelling to bridge the gap from behaviour to neural mechanisms by relating the computational requirements of navigational tasks to the type of computation offered by invertebrate brain circuits.

We have shown that visual memory of multiple views could be acquired by associative learning in the mushroom body neuropil, and allow insects to recapitulate long routes. We have also proposed a circuit in the central complex neuropil that integrates sky compass and optic flow information on an outbound path and can thus steer the animal directly home; moreover this circuit can be used for additional vector calculations such as finding novel shortcuts. The models are strongly constrained by neuroanatomy, and are tested in realistic agent and robot simulations.

## **Learning With No Data Collections**

Marco Gori

University of Siena

By and large, the spectacular results of machine learning rely on the appropriate organization of huge data collections, which has strongly pushed the development of top level solutions by big companies. In this talk we propose an orthogonal research direction where we expect that perceptual cognitive skills (e.g. in language, vision, and control) can emerge simply by of environmental interactions without needing to store and properly organize big data collections. The proposed approach relies on moving the framework of statistical machine learning to that of learning over time by solving optimization problems similar to those that are at the basis of laws in Physics. We show that any classic learning process arises from the forward solution of classic variational problems and provide preliminary experimental evidence of the effectiveness of the theory.

**Neural Spectrospatial Filter: On Beamforming in the Deep Learning Era**

DeLiang Wang

Ohio State University

As the most widely-used spatial filtering approach for multi-channel signal separation, beamforming extracts the target signal arriving from a specific direction. We present an emerging approach based on multi-channel complex spectral mapping, which trains a deep neural network (DNN) to directly estimate the real and imaginary spectrograms of the target signal from those of the multi-channel noisy mixture. In this all-neural approach, the trained DNN itself becomes a nonlinear, time-varying spectrospatial filter. How does this conceptually simple approach perform relative to commonly-used beamforming techniques on different array configurations and in different acoustic environments? We examine this issue systematically on speech dereverberation, speech enhancement, and speaker separation tasks. Comprehensive evaluations show that multi-channel complex spectral mapping achieves speech separation performance comparable to or better than beamforming for different array geometries, and reduces to monaural complex spectral mapping in single-channel conditions, demonstrating the versatility of this new approach for multi-channel and single-channel speech separation. In addition, such an approach is computationally more efficient than popular mask-based beamforming. We conclude that this neural spectrospatial filter is capable of superseding traditional and mask-based beamforming.

**“Bayesian inference, reinforcement learning, and the cortico-basal ganglia circuit”**

Kenji Doya

Okinawa Institute of Science and Technology

Bayesian inference is a standard way of handling uncertainties in sensory perception and reinforcement learning is a common way of acting in unknown environments. While they are used in combination for perception and action in uncertain environments, the similarity of their computations has been formulated as the duality of inference and control, or control as inference.

In this talk, I will review these theoretical frameworks and discuss their implications in understanding the common circuit architectures of the sensory and motor cortices, and possible roles of the basal ganglia in motor and sensory processing.

**Neuroinformatics, Neural networks and Neurocomputers for Brain-inspired AI: Challenges and Opportunities**

Nikola K Kasabov

Auckland University of Technology

The talk discusses briefly current challenges in AI, including: efficient learning of data (interactive, adaptive, life-long; transfer); interpretability and explainability; personalised predictive modelling and profiling; multiple modality of data (e.g. genetic, clinical, behaviour, cognitive, static, temporal, longitudinal); computational complexity; energy consumption; human-machine interaction.

Opportunities to address these challenges are presented through advancement in Neuroinformatics, Neural networks and Neurocomputers (the 3N). Neuroinformatics offer a tremendous amount of data and knowledge about how the human brain and the nervous system work. Many brain information processing principles can be now implemented in novel Neural network computational models, such as: sparseness of computation, leading to a much less computational complexity and a significant energy consumption; diversity in the NN architecture in terms of type of neurons and compartmentalisation of computations, which can improve results; cognitive computation, where bottom-up sensory information and top-down prior knowledge are used to speed-up the learning process; life-long and transfer learning; interactive and reinforcement learning (rather than batch-mode); self-organisation (rather than pre-defined number of layers and neurons); evolving spatio-temporal knowledge and many more. Some of these principles have already been used in neural network models, such as SOM (Kohonen), ART (Grossberg), ECOS ([1,2]), spiking neural networks (SNN) (Maass), [3]. The latter ones have inspired the development of neuromorphic hardware chips and Neurocomputers, characterised by much low power consumption, massive parallelism and fast processing.

# IEEE World Congress on Computational Intelligence

# WCCI 2024 Yokohama, Japan

## June 30 – July 5, 2024

WCCI is the world's largest technical event on computational intelligence, featuring the three flagship conferences of the IEEE Computational Intelligence Society (CIS) under one roof: The International Joint Conference on Neural Networks (IJCNN), the IEEE International Conference on Fuzzy Systems (FUZZ-IEEE) and the IEEE Congress on Evolutionary Computation (IEEE CEC). WCCI 2024 will be held in Yokohama, Japan. Yokohama is a city that inspires academic fusion and multidisciplinary & industrial association. The Yokohama area boasts a number of universities, institutes and companies of advanced information technology, electronics, robotics, mobility, medicine and foods. WCCI 2024 held in this area will strongly inspire the attendees to imagine next-generation science and technology as the fusion of AI, physiology and psychology as well as a cooperation with intelligence-related industries.

**IJCNN 2024** The International Joint Conference on Neural Networks (IJCNN) covers a wide range of topics in the field of neural networks, from biological neural networks to artificial neural computation.

**IEEE CEC 2024** The IEEE Congress on Evolutionary Computation (IEEE CEC) covers all topics in evolutionary computation from theory to real-world applications.

**FUZZ-IEEE 2024** The IEEE International Conference on Fuzzy Systems (FUZZ-IEEE) covers all topics in fuzzy systems from theory to real-world applications.

**Call for Papers**

Papers for IEEE WCCI 2024 should be submitted electronically through the Congress website at [wcci2024.org](http://wcci2024.org), and will be refereed by experts in the fields and ranked based on the criteria of originality, significance, quality and clarity.

**Call for Tutorials**

IEEE WCCI 2024 will feature pre-Congress tutorials, covering fundamental and advanced topics in computational intelligence. A tutorial proposal should include title, outline, expected enrollment, and presenter/organizer biography. Inquiries regarding tutorials should be addressed to Tutorials Chairs.

**Call for Special Session Proposals**

IEEE WCCI 2024 solicits proposals for special sessions within the technical scope of the three conferences. Special sessions, to be organized by internationally recognized experts, aim to bring together researchers in special focused topics.
